

### **General Description**

The MAX3222/MAX3232/MAX3237/MAX3241 transceivers have a proprietary low-dropout transmitter output stage enabling true RS-232 performance from a 3.0V to 5.5V supply with a dual charge pump. The devices require only four small 0.1µF external chargepump capacitors. The MAX3222, MAX3232, and MAX3241 are guaranteed to run at data rates of 120kbps while maintaining RS-232 output levels. The MAX3237 is guaranteed to run at data rates of 250kbps in the normal operating mode and 1Mbps in the MegaBaud™ operating mode, while maintaining RS-232 output levels.

The MAX3222/MAX3232 have 2 receivers and 2 drivers. The MAX3222 features a 1µA shutdown mode that reduces power consumption and extends battery life in portable systems. Its receivers remain active in shutdown mode, allowing external devices such as modems to be monitored using only 1µA supply current. The MAX3222 and MAX3232 are pin, package, and functionally compatible with the industry-standard MAX242 and MAX232, respectively.

The MAX3241 is a complete serial port (3 drivers/ 5 receivers) designed for notebook and subnotebook computers. The MAX3237 (5 drivers/3 receivers) is ideal for fast modem applications. Both these devices feature a shutdown mode in which all receivers can remain active while using only 1µA supply current. Receivers R1 (MAX3237/MAX3241) and R2 (MAX3241) have extra outputs in addition to their standard outputs. These extra outputs are always active, allowing external devices such as a modem to be monitored without forward biasing the protection diodes in circuitry that may have VCC completely removed.

The MAX3222, MAX3237, and MAX3241 are available in space-saving TSSOP and SSOP packages.

### **Applications**

Notebook, Subnotebook, and Palmtop Computers

High-Speed Modems

Battery-Powered Equipment

Hand-Held Equipment

Peripherals

**Printers** 

### Typical Operating Circuits appear at end of data sheet.

## **Next Generation Device Features**

- **♦** For Smaller Packaging: MAX3228E/MAX3229E: +2.5V to +5.5V RS-232 Transceivers in UCSP™
- **♦** For Integrated ESD Protection: MAX3222E/MAX3232E/MAX3237E/MAX3241E\*/ MAX3246E: ±15kV ESD-Protected, Down to 10nA, 3.0V to 5.5V, Up to 1Mbps, True RS-232 **Transceivers**
- **♦** For Low-Voltage or Data Cable Applications: MAX3380E/MAX3381E: +2.35V to +5.5V, 1µA, 2 Tx/2 Rx RS-232 Transceivers with ±15kV ESD-Protected I/O and Logic Pins

### **Ordering Information**

|   |

Note 1: V+ and V- can have a maximum magnitude of 7V, but their absolute difference cannot exceed 13V.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### **Detailed Description**

#### **Dual Charge-Pump Voltage Converter**

The MAX3222/MAX3232/MAX3237/MAX3241's internal power supply consists of a regulated dual charge pump that provides output voltages of +5.5V (doubling charge pump) and -5.5V (inverting charge pump), regardless of the input voltage (VCC) over the 3.0V to 5.5V range. The charge pumps operate in a discontinuous mode; if the output voltages are less than 5.5V, the charge pumps are enabled, and if the output voltages exceed 5.5V, the charge pumps are disabled. Each charge pump requires a flying capacitor (C1, C2) and a reservoir capacitor (C3, C4) to generate the V+ and V- supplies.

#### **RS-232 Transmitters**

The transmitters are inverting level translators that convert CMOS-logic levels to 5.0V EIA/TIA-232 levels.

The MAX3222/MAX3232/MAX3241 transmitters guarantee a 120kbps data rate with worst-case loads of  $3k\Omega$  in parallel with 1000pF, providing compatibility with PC-to-PC communication software (such as LapLink<sup>TM</sup>). Typically, these three devices can operate at data rates of 235kbps. Transmitters can be paralleled to drive multiple receivers or mice.

The MAX3222/MAX3237/MAX3241's output stage is turned off (high impedance) when the device is in shutdown mode. When the power is off, the MAX3222/MAX3232/MAX3237/MAX3241 permit the outputs to be driven up to  $\pm 12V$ .

The transmitter inputs do not have pullup resistors. Connect unused inputs to GND or VCC.

#### MAX3237 MegaBaud Operation

In normal operating mode (MBAUD = GND), the MAX3237 transmitters guarantee a 250kbps data rate with worst-case loads of  $3k\Omega$  in parallel with 1000pF. This provides compatibility with PC-to-PC communication software, such as Laplink.

For higher speed serial communications, the MAX3237 features MegaBaud operation. In MegaBaud operating mode (MBAUD = VCC), the MAX3237 transmitters guarantee a 1Mbps data rate with worst-case loads of 3k $\Omega$  in parallel with 250pF for 3.0V < VCC < 4.5V. For 5V  $\pm 10\%$  operation, the MAX3237 transmitters guarantee a 1Mbps data rate into worst-case loads of 3k $\Omega$  in parallel with 1000pF.

LapLink is a trademark of Traveling Software, Inc.

Figure 1. Slew-Rate Test Circuits

Figure 2. Detection of RS-232 Activity when the UART and Interface are Shut Down; Comparison of MAX3237/MAX3241 (b) with Previous Transceivers (a).

#### **RS-232 Receivers**

The receivers convert RS-232 signals to CMOS-logic output levels. The MAX3222/MAX3237/MAX3241 receivers have inverting three-state outputs. In shutdown, the receivers can be active or inactive (Table 1).

The complementary outputs on the MAX3237 (R1OUTB) and the MAX3241 (R1OUTB, R2OUTB) are always active, regardless of the state of EN or SHDN. This allows for Ring Indicator applications without forward biasing other devices connected to the receiver outputs. This is ideal for systems where VCC is set to 0V in shutdown to accommodate peripherals, such as UARTs (Figure 2).

#### MAX3222/MAX3237/MAX3241 Shutdown Mode

Supply current falls to less than 1 $\mu$ A in shutdown mode (SHDN = low). When shut down, the device's charge pumps are turned off, V+ is pulled down to VCC, V- is pulled to ground, and the transmitter outputs are disabled (high impedance). The time required to exit shutdown is typically 100 $\mu$ s, as shown in Figure 3. Connect SHDN to VCC if the shutdown mode is not used. SHDN has no effect on R\_OUT or R\_OUTB.

#### MAX3222/MAX3237/MAX3241 Enable Control

The inverting receiver outputs (R\_OUT) are put into a high-impedance state when  $\overline{\text{EN}}$  is high. The complementary outputs R1OUTB and R2OUTB are always active, regardless of the state of  $\overline{\text{EN}}$  and  $\overline{\text{SHDN}}$  (Table 1).  $\overline{\text{EN}}$  has no effect on T\_OUT.

### Applications Information

#### **Capacitor Selection**

The capacitor type used for C1–C4 is not critical for proper operation; polarized or nonpolarized capacitors can be used. The charge pump requires 0.1µF capacitors for 3.3V operation. For other supply voltages, refer to Table 2 for required capacitor values. Do not use values lower than those listed in Table 2. Increasing the capacitor values (e.g., by a factor of 2) reduces ripple on the transmitter outputs and slightly reduces power consumption. C2, C3, and C4 can be increased without changing C1's value. However, do not increase C1 without also increasing the values of C2, C3, and C4, to maintain the proper ratios (C1 to the other capacitors).

When using the minimum required capacitor values, make sure the capacitor value does not degrade excessively with temperature. If in doubt, use capacitors with a higher nominal value. The capacitor's equivalent series resistance (ESR), which usually rises at low temperatures, influences the amount of ripple on V+ and V-.

## Table 1. MAX3222/MAX3237/MAX3241 Shutdown and Enable Control Truth Table

| SHDN | EN | T_OUT  | R_OUT  | R_OUTB<br>(MAX3237/<br>MAX3241) |
|------|----|--------|--------|---------------------------------|
| 0    | 0  | High-Z | Active | Active                          |
| 0    | 1  | High-Z | High-Z | Active                          |
| 1    | 0  | Active | Active | Active                          |
| 1    | 1  | Active | High-Z | Active                          |

| 3.15 to 3.6            | 0.1        | 0.1                |
| 4.5 to 5.5             | 0.047      | 0.33               |
| 3.0 to 5.5             | 0.22       | 1.0                |

Figure 3. Transmitter Outputs when Exiting Shutdown or Powering Up

#### **Power-Supply Decoupling**

In most circumstances, a 0.1µF bypass capacitor is adequate. In applications that are sensitive to power-supply noise, decouple VCC to ground with a capacitor of the same value as charge-pump capacitor C1. Connect bypass capacitors as close to the IC as possible.

#### Operation Down to 2.7V

Transmitter outputs will meet EIA/TIA-562 levels of ±3.7V with supply voltages as low as 2.7V.

## Transmitter Outputs when Exiting Shutdown

Figure 3 shows two transmitter outputs when exiting shutdown mode. As they become active, the two transmitter outputs are shown going to opposite RS-232 levels (one transmitter input is high, the other is low). Each transmitter is loaded with  $3k\Omega$  in parallel with 2500pF. The transmitter outputs display no ringing or undesirable transients as they come out of shutdown. Note that the transmitters are enabled only when the magnitude of V- exceeds approximately 3V.

#### **Mouse Driveability**

The MAX3241 has been specifically designed to power serial mice while operating from low-voltage power supplies. It has been tested with leading mouse brands from manufacturers such as Microsoft and Logitech. The MAX3241 successfully drove all serial mice tested and met their respective current and voltage requirements. Figure 4a shows the transmitter output voltages under increasing load current at 3.0V. Figure 4b shows a typical mouse connection using the MAX3241.

Figure 4a. MAX3241 Transmitter Output Voltage vs. Load Current per Transmitter

Figure 4b. Mouse Driver Test Circuit

Figure 5. Loopback Test Circuit

#### **High Data Rates**

The MAX3222/MAX3232/MAX3241 maintain the RS-232 ±5.0V minimum transmitter output voltage even at high data rates. Figure 5 shows a transmitter loopback test circuit. Figure 6 shows a loopback test result at 120kbps, and Figure 7 shows the same test at 235kbps. For Figure 6, all transmitters were driven simultaneously at 120kbps into RS-232 loads in parallel with 1000pF. For Figure 7, a single transmitter was driven at 235kbps, and all transmitters were loaded with an RS-232 receiver in parallel with 1000pF.

The MAX3237 maintains the RS-232  $\pm 5.0$ V minimum transmitter output voltage at data rates up to 1Mbps. Figure 8 shows a loopback test result at 1Mbps with MBAUD = V<sub>CC</sub>. For Figure 8, all transmitters were loaded with an RS-232 receiver in parallel with 250pF.

Figure 6. MAX3241 Loopback Test Result at 120kbps

Figure 7. MAX3241 Loopback Test Result at 235kbps

Figure 8. MAX3237 Loopback Test Result at 1000kbps (MBAUD = VCC)

#### Interconnection with 3V and 5V Logic

The MAX3222/MAX3232/MAX3237/MAX3241 can directly interface with various 5V logic families, including ACT and HCT CMOS. See Table 3 for more information on possible combinations of interconnections.

Table 3. Logic-Family Compatibility with Various Supply Voltages

| SYSTEM<br>POWER-<br>SUPPLY<br>VOLTAGE<br>(V) | MAX32<br>Vcc<br>SUPPLY<br>VOLTAGE<br>(V) | COMPATIBILITY  |
|--|--|--|
| 3.3  | 3.3                                      | Compatible with all CMOS families.   |
| 5  | 5  | Compatible with all TTL and CMOS-logic families.   |
| 5  | 3.3                                      | Compatible with ACT and HCT CMOS, and with TTL. Incompatible with AC, HC, and CD4000 CMOS. |

### **Chip Topography**

### **Chip Information**

TRANSISTOR COUNT: 339 SUBSTRATE CONNECTED TO GND

| PART    | TRANSISTOR COUNT |
|---------|------------------|
| MAX3222 | 339              |
| MAX3232 | 339              |
| MAX3237 | 1212             |
| MAX3241 | 894              |

### **Package Information**

(The package drawing(s) in this data sheet may not reflect the most current specifications. For the latest package outline information, go to <a href="https://www.maxim-ic.com/packages">www.maxim-ic.com/packages</a>.)

### \_Revision History

Pages changed at Rev 7: 1, 15, 16, 17

Maxim cannot assume responsibility for use of any circuitry other than circuitry entirely embodied in a Maxim product. No circuit patent licenses are implied. Maxim reserves the right to change the circuitry and specifications without notice at any time.
